

### The Guide to Ceramic Chimney Systems and Liners

DON'T FORGET TO REGISTER YOUR INSTALLATIONS AND START EARNING SCHIEDEL INSTALLER REWARDS See inside for more details

### The Schiedel Ceramic Range

In order to meet the new European Standards for Chimney products, specific leakage and performance criteria have to be met, which are much more stringent than in the past.

Schiedel have invested in the latest production technology and are proud to introduce a new range of high performance rebated ceramic flue liners, which are fully CE tested and approved and are fully compatible with the increasingly efficient modern appliances, as well as meeting the more traditional soot fire requirements.

These liners are now used throughout the Schiedel range of standard ceramic chimney products, which consists of:-

- Ceramic Chimney Liners
- Swift System Chimney
- Swift Air System Chimney for room sealed appliances

Schiedel has sourced the finest raw materials, blended in a unique formula to give a unique combination of temperature resistance and strength.

### The natural properties of ceramic

#### Resistant to Thermal Shock

The liners are extremely durable and have been tested for resistance to soot fire as well as to condensate, and meet the latest CE standards and Construction Products Regulations (CPR).

### Lightweight

Due to advanced manufacturing techniques, we have been able to reduce the wall thickness of the liner to produce the optimal lightweight but extremely robust product.

### Smooth Inner Wall

The smooth inner liner allows gas, the product of combustion to freely exit the chimney. Straight lines ensure a consistent fill of insulation.

### Product Description

The Schiedel Ceramic Product Range consists of Chimney liners for the refurbishment of existing chimneys as well as System Chimneys for New Build Applications and System Chimneys with a built in ventilation channel for use in room sealed applications on energy efficient houses.

### **CERAMIC FLUE LINERS**

The Schiedel range of Ceramic Flue Liners has been tested and approved to meet the latest European Standards and Construction Product Regulations (CPR) for both High Temperature and Low Temperature applications.

### SCHIEDEL SWIFT

Schiedel Swift is a high quality modular System Chimney comprising of 3 layers. An outer block stone, an insulation wrap and a ceramic liner, CE approved for use on both high temperature and low temperature applications. The system can be installed internally or externally and is ideal for new Build applications.

### **SCHIEDEL SWIFT AIR**

Schiedel Swift Air is a 3 layer Modular System Chimney with a built in channel for ventilation, which allows the system to be used with room sealed appliances, bringing the combustion air to the appliance from roof level, ensuring the right volume of combustion air is available to the appliance. This system is ideal for use in Energy efficient A rated New Build Homes.

### **CHIMNEY POTS & ACCESSORIES**

Schiedel Chimney Pots and accessories are designed to bring simple, aesthetic solutions to the Chimney design, both within the fireplace and through to termination, with a range of styles to suit all homes.

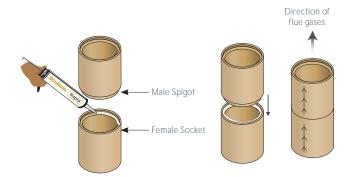

### Ceramic Flue Liners – Traditional Build

In order to meet the new European Standards for Chimney products, specific leakage and performance criteria have to be met, which are much more stringent than in the past.

Schiedel have invested in the latest production technology and are proud to introduce a new range of high performance rebated ceramic flue liners, which are fully CE tested and approved and are fully compatible with the increasingly efficient modern appliances, as well as meeting the more traditional soot fire requirements.

This new generation of rebated ceramic chimney liners is available as standard in the following diameter range: 160mm, 180mm, 200mm, 250mm, 300mm.

### Joint Detail

Liners are installed with the male spigot pointing downwards. Schiedel Rapid HT Cement should be applied to the inside of the female socket and any excess projecting into the flue should be wiped off as installation progresses.

### RAPID HT CEMENT USAGE

Int Ø (mm)	No. Joints per tube

## Ceramic Flue Liners – Installation Guidelines

### **BUILDING REGULATIONS**

The construction and application of chimneys and flues is covered by Building Regulations in conjunction with the relevant European Standards. Whilst these differ in emphasis, they all mandate the safe application of the chimney no matter where and how used. These Regulations and Standards dictate the minimum criteria which it is necessary to apply if the chimney or flue is to function safely and correctly.

Building control approval is necessary for building new chimneys and in some cases for relining old chimneys particularly if some alteration or change of the heating appliance occurs. The appropriate Regulations and Standards are listed below.

England & Wales:

Building Regulations Approved Document J

Scotland

Building Regulations Technical Standards

Northern Ireland:

Building Regulations Technical Booklet L

Republic of Ireland:

Building Regulations Technical Guidance Document J

**FLUE SIZING** 

It is important to match the internal diameter of the flue with the outlet on the appliance. It should never be less than the outlet diameter of the appliance. The appliance manufacturer's chimney sizing recommendations should always be followed.

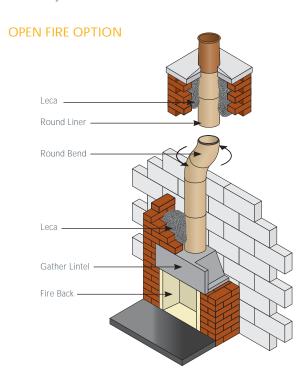

For open fires with a standard fire opening up to 500mm wide by 550mm high the minimum required flue diameter is 200mm round. For larger open fires, such as inglenooks, dog grate installations or special appliances and stoves designed to operate with a fire opening greater than 500mm x 550mm, the flue size should be at least 15% of the free unobstructed area of the fire opening (including sides if open). Many Decorative Fuel Effect gas fires (DFE's) that imitate a coal or log burning open fire require the same chimney arrangement as for solid fuel open fires and must be installed in accordance with respective local building regulations

### **OPEN FIRE OPTION**

Construction begins by providing a suitable foundation and constructional hearth in accordance with local Building Regulations and site requirements.

Form the fire opening onto the constructional hearth. 100mm of brick or blockwork must be built around the sides and back of the firechest to comply with Building Regulations.

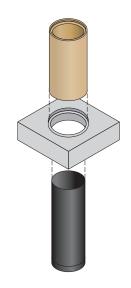

Apply Schiedel Rapid HT Cement onto a suitably formed fire gather. Position the flue liner onto the prefabricated gather, female rebate facing upwards. Arrows on each flue liner indicate the directional flow of flue gases. Continue to apply Schiedel Rapid HT Cement to each flue liner, cleaning any access material from the joints.

#### **RECESSED STOVE OPTION**

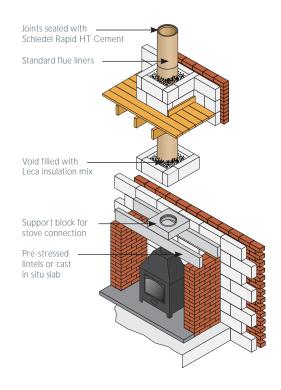

A suitable cast-in-situ concrete slab lintel must be provided above the fireplace recess. Alternatively you could use suitable pre stressed lintels, for this method a support plate is required under the support block. It is recommended to have a minimum of 600mm length of flue pipe before connecting to the chimney.

The support block is bedded onto the slab lintel using weak mix mortar. A stainless steel adaptor or a section of Prima Smooth connecting flue pipe is used to connect from the support block to the stove flue pipe. This adaptor is pushed up onto the support block spigot (fibre rope should be used to create a seal).

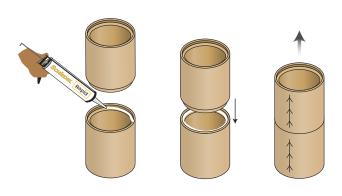

# Ceramic Flue Liners – Installation Guidelines

### **RECESSED STOVE OPTION**

### **ALL OPTIONS**

Apply Schiedel HT Cement onto the male rebate of the flue liner. (refer to table on page 3)

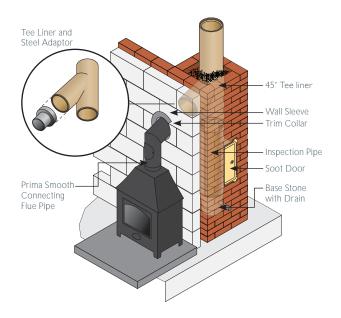

Position the flue liner on a suitably formed fire gather or support block with the female rebate facing upwards. Arrows on each flue liner indicate the directional flow of flue gases. Continue to apply high temperature cement to each flue liner, cleaning any access material from the joints.

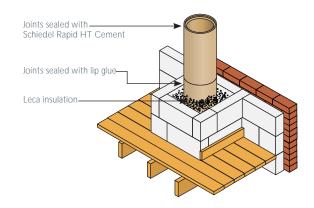

### FREE STANDING STOVE OPTION

A soot door must be provided below the flue pipe entry to allow for inspection and removal of soot and debris. A suitable wall sleeve is to be used to seal the cavity wall. Any combustible insulation within the wall must be kept away from the single skin connecting flue pipe by at least 1.5 x its diameter

(Example: diameter 150mm x 1.5 = 225mm distance).

The flue pipe is a push fit over the spigot on the adaptor. Seal off the gap between the flue pipe and wall sleeve with fire proof rope and closing plate.

Clad the flue liners with a minimum of 100mm suitable masonry. A minimum of 15mm Leca insulation must be installed between the flue liners and masonry. Mix 20 parts Leca to 1 Part cement and a small amount of water. Ensure it is well mixed before using. (refer to table on page 3)

## Ceramic Flue Liners – Installation Guidelines

If Bends are required in the chimney make sure adequate support is provided and always backfill with leca insulation mix. Liners can be cut between bends to achieve a required offset distance. A steel collar as well as high temperature cement must be used for any cut joints. A maximum of 2 complete offsets (4 bends) are allowed per chimney and the angle must not be greater than 45° from the vertical.

#### SUPPORTING AN OFFSET

The bends and liners that make up an offset must be supported adequately

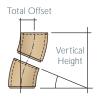

Diameter (mm)	Bends 30°	Length 330mm	Total Height	Total Offset
160	2	0	596	155
160	2	1	880	320
180	2	0	600	161
180	2	1	888	326
200	2	0	596	160
200	2	1	881	325
250	2	0	559	157
250	2	1	839	318
300	2	0	610	164
300	2	1	892	326

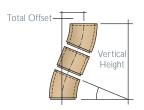

Diameter (mm)	Bends 37.5°	Length 330mm	Total Height	Total Offset
160	2	0	580	197
160	2	1	842	398
180	2	0	569	193
180	2	1	830	394
200	2	0	568	190
200	2	1	830	392
250	2	0	569	209
250	2	1	814	425

Diameter (mm)	Bends 45°	Length 330mm	Total Height	Total Offset
160	2	0	545	222
160	2	1	779	455
180	2	0	545	226
180	2	1	779	460
200	2	0	545	226
200	2	1	779	460
250	2	0	553	233
250	2	1	794	461

### **OFFSET WITH 2 BENDS**

### OFFSET WITH 2 BENDS & LINER

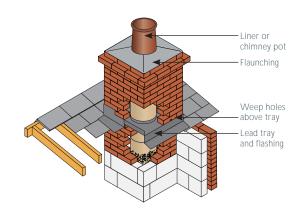

You must provide adequate clearance from combustible material in accordance with local Building Regulations. Combustible materials must be 200mm from the inner surface of flue liner or 40mm from the outside of the masonry chimney unless it is a floorboard, skirting board, dado or picture rail, mantel-shelf or architrave.

Fit appropriate lead dpc's and flashings in accordance with the relevant regulations. It is recommend that the lead tray should be dressed up the outside of the flue liners to avoid a weak joint. Weep holes should be provided above the tray for moisture drainage.

Terminate the chimney to the correct height in accordance with local Building Regulations. The chimney can be finished by flaunching (1:3 cement/sharp sand) around a suitable chimney pot. Approved rain caps can be used to help prevent water entering the flue.

#### AFTER COMPLETION

After installation is complete tests and checks should be carried out in accordance with local Building Regulations. A chimney notice plate must be completed and permanently fixed in the dwelling, ideally near the electrical consumer unit. The checklist and notice plate are available from Schiedel.

### **USE AND MAINTENANCE**

The chimney should be swept at least twice a year, once before the heating season and once after the heating season. You may need to sweep during the heating season depending upon use.

Always follow the appliance manufacturer's operating instructions. Always burn approved fuels or dry seasoned wood. Avoid burning unseasoned wood and slow burning of solid fuels as this can produce excessive soot and condensation which can in turn cause soot fires and damage. If correctly installed, operated and maintained these systems should last the life of the dwelling.

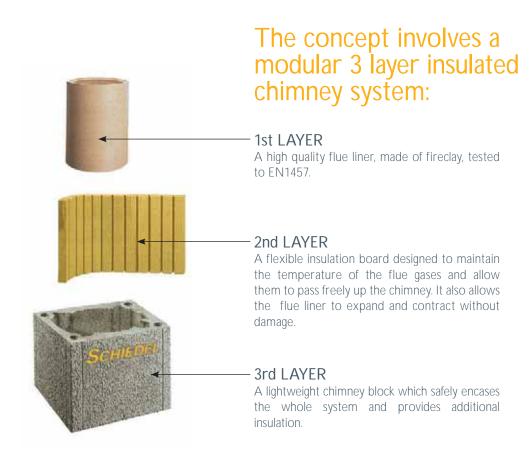

### The Schiedel Swift Chimney System Concept

The Schiedel Swift Chimney System is a ceramic chimney system designed in modular units which can be quickly assembled on site, significantly reducing the chimney construction time.

The chimney system can be adapted to suit all types of appliances including open fires, multi-fuel stoves, boilers and other bespoke applications.

### **Key Features**

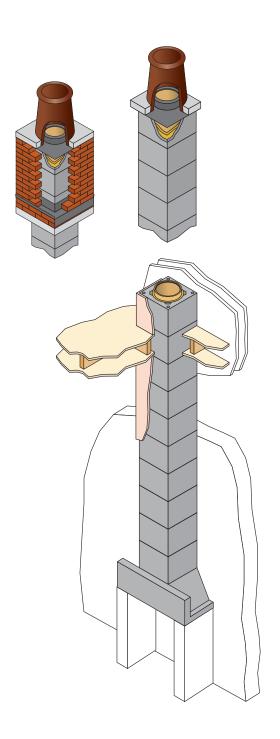

- Designed for speed of construction
- Suitable for Timber Frame, Steel Frame and Masonry construction. Solutions have been specifically designed to meet the requirement of timber framed construction.
- Modular units for easy assembly on site.
- Suitable for all fuels gas, oil, solid fuels and biomass.
- Schiedel Rapid HT Cement is provided in tubes for ease of application.
- Superior Insulation The consistency of the insulation maintains the temperature of the flue gases allowing them to pass freely up the chimney. Back filling of insulation is not required.
- The use of a chimney tray is always recommended.
- The high quality fireclay flue liner complies with the European Standard EN1457-1 & 2

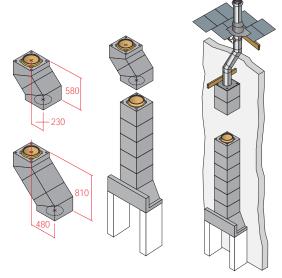

## Schiedel Swift – Open Fires

### **INTERNAL OPEN FIRE**

(Timber frame, steel frame and masonry construction) Single chimney for timber frame, steel frame or masonry constructions. Available with a corbel for 3 brick wide (675mm) brick or rendered stack, or as a Plain Swift without the corbel stack (360mm square). Strengthening bars only required if chimney is taller than 1.2m.

#### **BEND & OFFSETS**

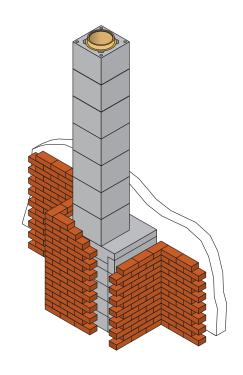

It is recommended that a chimney be constructed as a straight chimney. Were a bend is required, for example to move the chimney into a corner in the first floor, a Schiedel Swift bend kit can be used.

The Breast Bend The breast bend kit will allow the flue to be offset to variable lengths, subject to the diameter being used. (See offset chart page 8)

The Roof Space Offset Kit A combination of both Schiedel Swift and Schiedel Twin wall stainless steel flue allows an offset in the roof space without the need for constructional support.

### **EXTERNAL OPEN FIRE / FREE STANDING STOVE**

Suitable for a single chimney where the chimney is on the outside of the building. A bend kit can be used to offset the chimney to one side.

### Schiedel Swift - Stoves & Boilers

The Schiedel Swift is also an ideal solution for stoves, cookers and central heating boilers. Neat and simple solutions suit a variety of installations.

These options offer all the benefits of the Open Fire solutions with tailor made components to simplify construction. The accessories on the stoves, cookers and boiler systems include preformed junction pipes and inspection doors for ease of maintenance. For stoves, cookers and boilers the system is available in 160mm, 180mm and 200mm internal flue diameters.

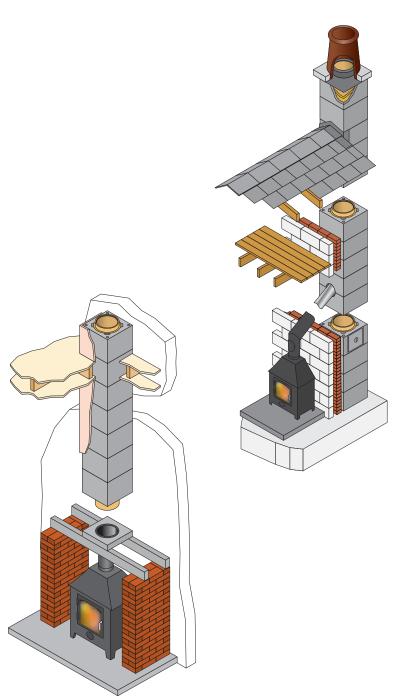

### **INTERNAL RECESSED STOVE**

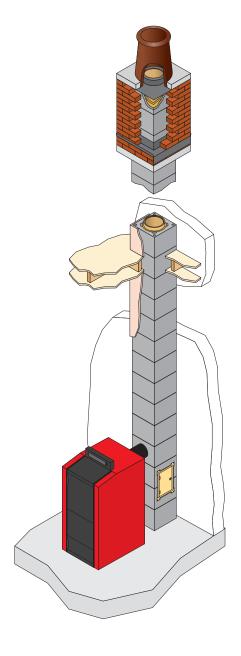

Chimney system to suit oil burning and solid fuel stoves.

#### FREE STANDING STOVE

### ROILERS

Chimney system for gas, oil and biomass boilers.

### **BUILDING REGULATIONS**

The construction and application of chimneys and flues is covered by Building Regulations in conjunction with the relevant European Standards. Whilst these differ in emphasis, they all mandate the safe application of the chimney no matter where and how used. These Regulations and Standards dictate the minimum criteria which it is necessary to apply if the chimney or flue is to function safely and correctly.

Building control approval is necessary for building new chimneys and in some cases for relining old chimneys particularly if some alteration or change of the heating appliance occurs. The appropriate Regulations and Standards are listed below.

### England & Wales:

Building Regulations Approved Document J

#### Scotland:

**Building Regulations Technical Standards** 

### Northern Ireland:

Building Regulations Technical Booklet L

### Republic of Ireland:

Building Regulations Technical Guidance Document J

### **FLUE SIZING**

It is important to match the internal diameter of the flue with the outlet on the appliance. It should never be less than the outlet diameter of the appliance. The appliance manufacturer's chimney sizing recommendations should always be followed.

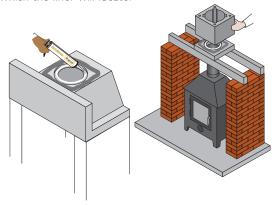

For open fires with a standard fire opening up to 500mm wide by 550mm high the minimum required flue diameter is 200mm round. For larger open fires, such as inglenooks, dog grate installations or special appliances and stoves designed to operate with a fire opening greater than 500mm x 550mm, the flue size should be at least 15% of the free unobstructed area of the fire opening (including sides if open). Many Decorative Fuel Effect gas fires (DFE's) that imitate a coal or log burning open fire require the same chimney arrangement as for solid fuel open fires and must be installed in accordance with respective local building regulations.

### **FOUNDATIONS**

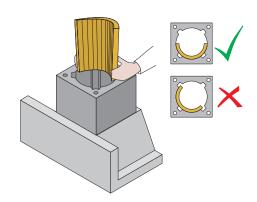

Construction begins by providing a suitable foundation and constructional hearth in accordance with Building Regulations and site requirements.

### **CHIMNEY CONSTRUCTION**

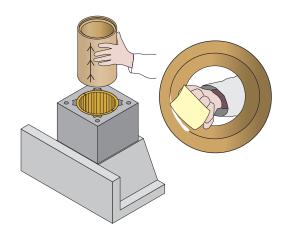

1. The first chimney block is set on a bed of mortar on top of the prefabricated gather or support block, depending on your appliance. Schiedel Rapid HT Cement is applied to the recess into which the liner will locate.

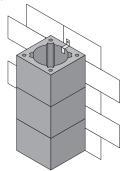

2. Bend and place the insulation into the chimney block. Care should be taken to ensure the slots in the mineral wool are compressed inwards. It is important the insulation is fitted as below to ensure consistent insulation around the flue pipe.

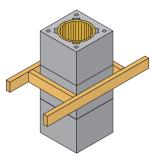

3. Place the flue liner into the chimney block. with the female rebate facing upwards. Arrows on each flue liner indicate the directional flow of flue gases. Continue to apply high temperature cement to each flue liner, cleaning any access material from the joints.

4. The chimney blocks should be tied every metre to a structural wall with the supplied masonry/steel frame ties. Standard timber frame ties (not included) should be used in timber frame construction.

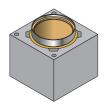

5. Where the chimney passes through floor or ceiling joists, these need to be trimmed out leaving a gap of 40mm for timber and 30mm for concrete. This gap is then filled with noncombustible material.

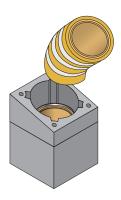

### **BEND KIT**

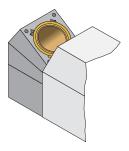

1. Build the chimney to the point where the bend is required. The steel locking band should be placed around the liner in the chimney block before the bend.

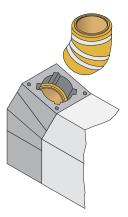

2. Place the first chimney bend block on top of the standard chimney block. Insert the first insulated flue bend.

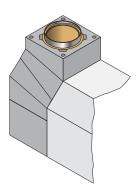

**3.** Add the second chimney bend block with the angled edge face down. Make sure the block is properly supported.

**4.** Place the straight edge of the third chimney bend block on top. Insert the insulated ceramic return bend into the bend block

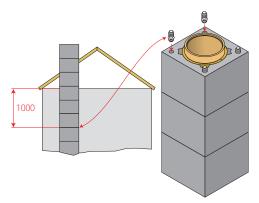

**5.** Position the final bend block angle edge down to return the kit to the horizontal. The steel locking band should be placed around the liner in the chimney block before continuing to add more blocks.

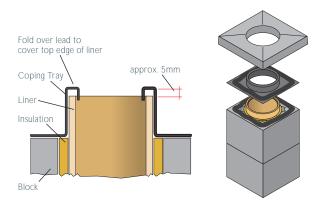

### **RENDERED STACK**

1. Continue to build the chimney as a single block to the stack. Special plastic connectors are inserted in all 4 corners of the chimney block to provide stability against wind loading. These should be used from a point 1 metre below the last point of lateral support.

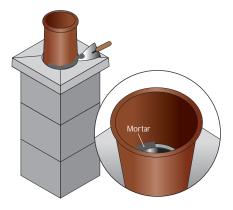

Reinforcement bars should be used instead of the plastic connectors for chimney stacks over 1.2m high. (see p. 17)

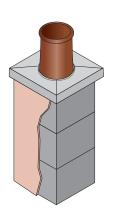

2. Place the coping on a bed of mortar on top of the DPC coping tray.

3. Place the chimney pot on the coping ensuring the space between the pot and coping is sealed with mortar or other nonporous material

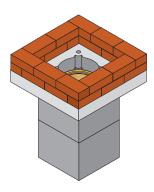

4. Finally apply an exterior waterproof render.

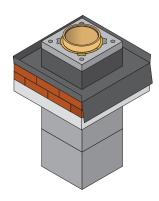

#### **BRICK STACK**

**1.** A corbel is required for brick or block cladding. This give a stack of 675mm x 675mm or 3 bricks by 3 bricks.

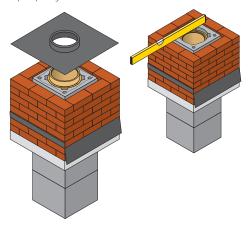

2. Continue to build the chimney block on the corbel. Keep the cavity between the block and outer skin clear of mortar. A chimney tray is recommended for brick clad stacks. Fit the chimney tray over the chimney block and let it rest on the bricks as shown with the apron on the slope side. Wall weeps should be put into the brick joints to ventilate and remove any trapped moisture.

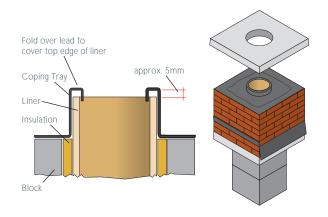

Chimney Trays are an additional option and can be produced to specific requirements.

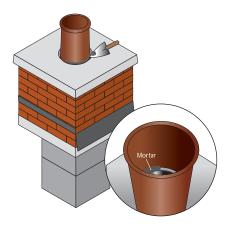

3. Before placing the coping tray into position, ensure the chimney block and the outer skin are at the same level at the top of the stack. Place the coping tray into position on a bed of mortar and ensure the gap between chimney block and outer skin is sealed properly.

**4.** Place the coping on a bed of mortar on top of the DPC coping tray.

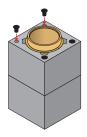

5. Place the chimney pot on the coping ensuring the space between the pot and coping is sealed with mortar or other non-porous material. Also inside the chimney pot seal the space between the pot and expansion plate with mortar or other non-porous material.

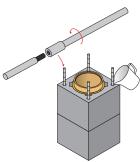

### **REINFORCING BARS**

Reinforcement bars should be used instead of the plastic connectors for chimney stacks over 1.2m high. The bars must start 1m below the last point of lateral support.

1. Start by inserting the plastic stoppers into the holes on the block before the first one with bars.

2. Screw the bars together and inset equal lengths into the 4 holes. The liquid grouting mortar should be poured into the reinforcing channels. Keep the reinforcing bars centred.

### AFTER COMPLETION

After installation is complete tests and checks should be carried out in accordance with document J of the Building Regulations. A chimney notice plate must be completed and permanently fixed in the dwelling, ideally near the electrical consumer unit. The checklist and notice plate are available from Schiedel.

### **USE AND MAINTENANCE**

The chimney should be left for at least 72 hours before use, then start only with small fires for the first week and gently increase thereafter.

The chimney should be swept at least twice a year, once before the heating season and once after the heating season. You may need to sweep during the heating season depending upon use. The brush should be a medium density polypropylene bristle type and should be the same diameter as the flue. Steel brushes must not be used to sweep the flues.

Always follow the appliance manufacturer's operating instructions. Always burn approved fuels or dry seasoned wood. Avoid burning unseasoned wood and slow burning of solid fuels as this can produce excessive soot and condensation which in turn cause soot fires and damage. If correctly installed, operated and maintained these systems should last the life of the dwelling.

### Schiedel Swift Air Chimney System Concept

Manufactured to EN13063-1: 2003-8

In an A rated house the combustion air required for wood burning appliance like a stove burning logs or wood pellets must be supplied directly to the stove from outside the house. These appliances are called room sealed as they are manufactured not to take air from the room. The Schiedel Swift Air provides all the benefits of the Schiedel Swift and in addition neatly and simply delivers the external air to the stove.

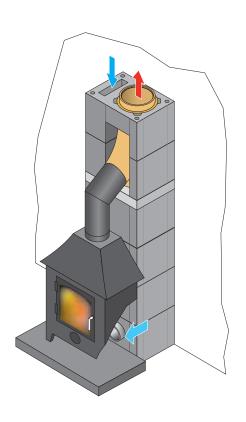

The alternative to Schiedel Swift Air is low level or under floor ducting ideally with air supplies from opposite sides of the house.

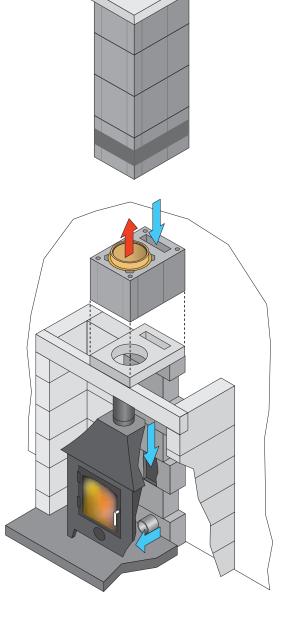

The Schiedel Swift Air solution avoids this by ducting the air through an external air shaft in the chimney.

Available in 150mm, 180mm and 200mm internal flue diameters. The size of the chimney block is the same for each flue diameter - 500mm x 360mm x 330mm high.

### TWO OPTIONS ARE AVAILABLE

- Recess Stove
- Free Standing Stove or Boiler

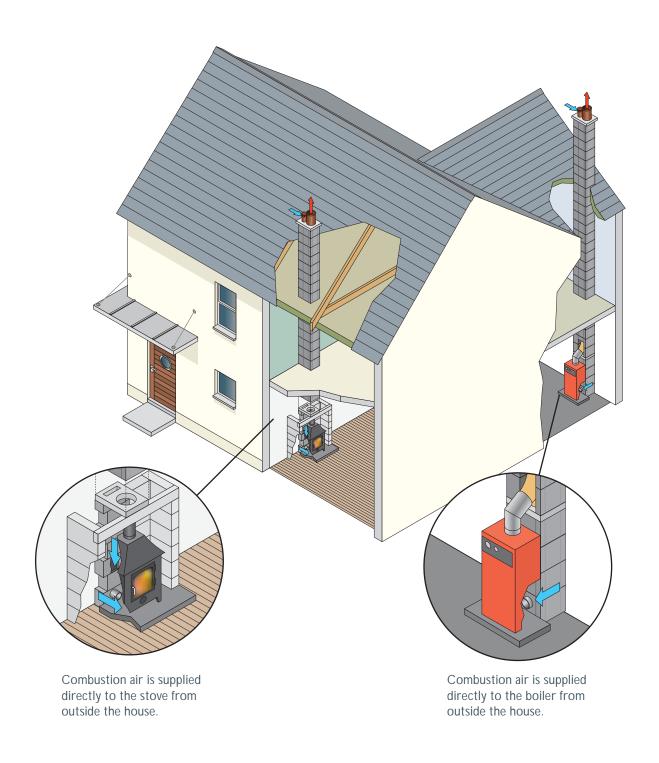

# Schiedel Swift Air in an Energy Efficient House

The heated air circulates within the house. The stove and the boiler do not take air from inside the house so no warm air is lost through the chimneys.

- Schiedel, enabling energy efficiency.

#### **BUILDING REGULATIONS**

The construction and application of chimneys and flues is covered by Building Regulations in conjunction with the relevant European Standards. Whilst these differ in emphasis, they all mandate the safe application of the chimney no matter where and how used. These Regulations and Standards dictate the minimum criteria which it is necessary to apply if the chimney or flue is to function safely and correctly.

Building control approval is necessary for building new chimneys and in some cases for relining old chimneys particularly if some alteration or change of the heating appliance occurs. The appropriate Regulations and Standards are listed below.

### England & Wales:

Building Regulations Approved Document J

#### Scotland:

**Building Regulations Technical Standards** 

### Northern Ireland:

Building Regulations Technical Booklet L

#### Republic of Ireland:

Building Regulations Technical Guidance Document J

### **FLUE SIZING**

It is important to match the internal diameter of the flue with the outlet on the appliance. It should never be less than the outlet diameter of the appliance. The appliance manufacturer's chimney sizing recommendations should always be followed.

For open fires with a standard fire opening up to 500mm wide by 550mm high the minimum required flue diameter is 200mm round or 175mm square. For larger open fires, such as inglenooks, dog grate installations or special appliances and stoves designed to operate with a fire opening greater than 500mm x 550mm, the flue size should be at least 15% of the free unobstructed area of the fire opening (including sides if open). Many Decorative Fuel Effect gas fires (DFE's) that imitate a coal or log burning open fire require the same chimney arrangement as for solid fuel open fires and must be installed in accordance with respective local building regulations

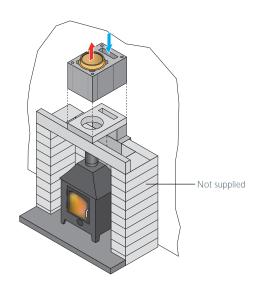

### **FOUNDATIONS**

Construction begins by providing a suitable foundation and constructional hearth in accordance with Building Regulations and site requirements.

#### RECESSED STOVE OPTION

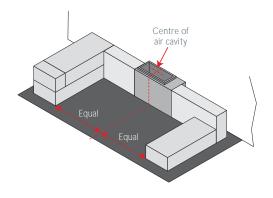

The Schiedel Air System is a specially designed balanced flue that connects a Room Sealed Appliance to fresh air and enables combustion gases to escape safely. Therefore, in the majority of installations there is no need for air vents to be provided for the appliance.

1. The recess height and width are open to personal choice depending on the size of the heating appliance. The components provided allows for an opening of H1200mm x W900mm. If a wider opening is required you will need to source a longer lintel which must be certified to span the width of the recess and support 2,100kg. An additional lintel may be added to make the recess deeper as required.

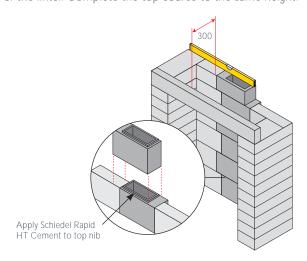

2. Lay a damp proof course. Place the air block on a mortar bed and start to build the recess. The air block is 140mm deep, either use a block this deep or build a standard block flush with the front of the air block and leave a gap to the rear.

Mark the centre of air cavity on the front of the air block and place in centre of recess. The air block can be built tight against the wall. If timber frame construction, attach the plasterboard before constructing the recess and the chimney.

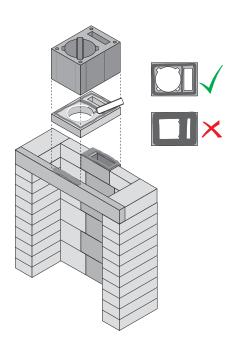

3. Build up the Air Block, (HP3), in line with standard block, alternating on each row to ensure the block will 'tie in' and form a staggered joint. Ensure the joints are completely sealed and the air cavity is kept clear of access mortar.

Once the desired height is reached add the lintel to the front of the recess. If necessary cut the top air block to sit level with top of the lintel. Complete the top course to the same height.

4. Lay a bed of mortar on lintel and air block. Place starter block on top of lintel and back wall, align the rectangular hole to the back so it matches with hole in the air block. Ensure that the joint between the air block and the support block is sealed with mortar. Run a bead of high temperature cement around the flue aperture on the support block.

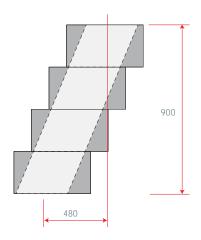

Place the first chimney block on the support block. Wipe away any excess and mortar, particularly in the air chamber as you do not want to restrict the flow of air.

#### **OFFSETS**

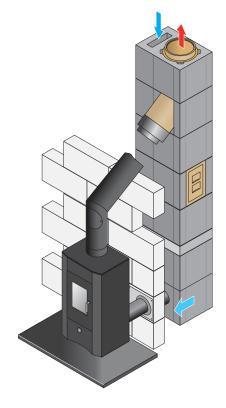

There is no bend kit available for the Schiedel Air System however, an offset can be obtained by using the HP5 block within the stove recess. Each HP5 block has an offset of 120mm.

### TYPICAL OFFSET USING HP5 BLOCKS

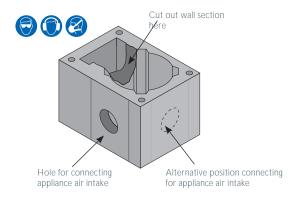

### FREE STANDING STOVE OPTION

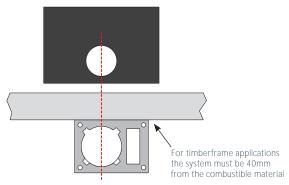

With a Free Standing stove, the chimney will not be positioned above the appliance. It is then necessary to provide a cleaning access and debris removal area. If it is a condensing appliance, a base stone can be used to collect the condensate. Provision should be made for the proper disposal of condensate.

- 1. Core drill a suitable diameter hole in accordance with the appliance manufacturer's instructions.
- 2. Cut out a section of wall between the air gap and the flue section in the first block no smaller than the cross-sectional area of the air channel. This allows the air intake to be placed at front or side of the block.

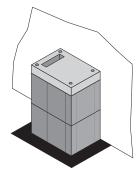

**3.** Ensure the exhaust outlet of the appliance is aligned with the junction pipe of the chimney.

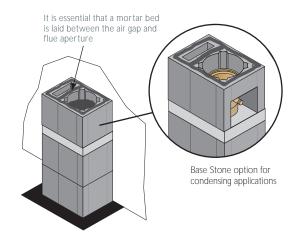

4. Lay a damp proof course. Lay a bed of mortar and place the chimney block with the removed section into desired position. Add the required number of additional chimney blocks (refer to table on page 25) depending on how high the connecting tee needs to be to suit your appliance.

Place the universal starter block on a bed of mortar on top of this chimney block. Line up the air gap in the block with the air gap in the support block.

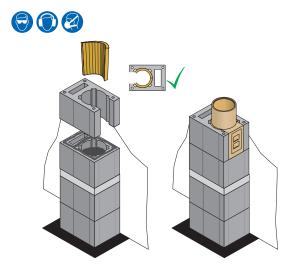

**5.** Apply a bed of mortar to the top of the universal starter block and place another chimney block.

6. Fill in the bottom half of the chimney shaft with mortar so as to allow for the inspection pipe to sit into. This will mean only having to cut one chimney block to accommodate the inspection pipe.

For condensing appliances you will need to use a base stone in place of the mortar to allow for the condensate to be drained off and disposed of.

7. Place the next cut chimney block on a bed of mortar. (A cardboard cutting template is supplied on the front of the inspection door)

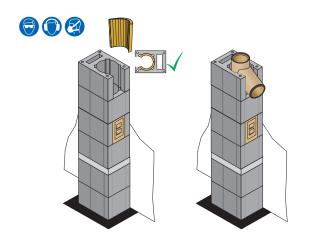

It is essential that a mortar bed is laid between the air gap and flue aperture. bend the insulation around the inside of the chimney block. Once fitted, cut the insulation along the ventilation channel.

8. Put a bead of high temperature cement around the bottom rebate of the inspection pipe, place it in the chimney block (socket uppermost).

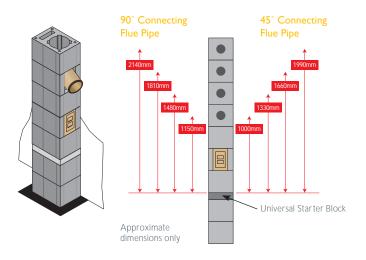

- 9. Place a standard chimney block on a bed of mortar. Bend and insert insulation. Next place the final cut block on a bed of mortar. (A cardboard cutting template is supplied on the front of the inspection door)
- 10. Bend and place the insulation around the inside of the cut block and cut along the ventilation channel. Apply high temperature cement to the socket end of junction pipe and place into block.

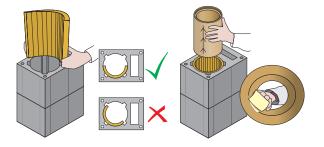

12. Bend the two pieces of insulation into the block. It is important the insulation is fitted as inset illustration to avoid the insulation going into the moulded recess within the chimney block.

Place the flue liner into the chimney block, with the female rebate facing upwards. Arrows on each flue liner indicate the directional flow of flue gases. Continue to apply high temperature cement to each flue liner, cleaning any access material from the joints.

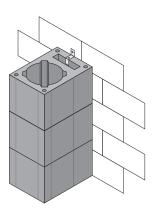

11. Add a standard block on a bed of mortar. Fit insulation around the junction pipe.

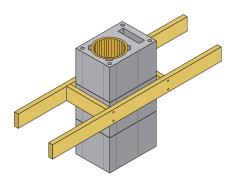

13. The chimney blocks should be tied every metre to a structural wall with the supplied masonry/steel frame ties. Standard timber frame ties should be used in timber frame construction.

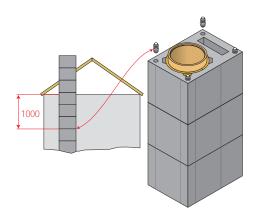

14. Where the chimney passes through floor or ceiling joists, these need to be trimmed out leaving a gap of 40mm for timber and 30mm for concrete. This gap is then filled with noncombustible material.

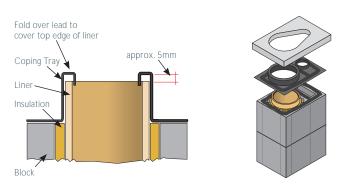

### RENDERED STACK

1. Continue to build the chimney as a single block to the stack. Special plastic connectors are inserted in all 4 corners of the chimney block to provide stability against wind loading. These should be used from a point 1 metre below the last point of lateral support.

Reinforcement bars should be used instead of the plastic connectors for chimney stacks over 1.2m high. (see p. 27)

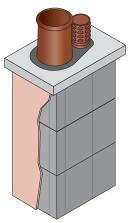

2. Place the coping on a bed of mortar on top of the DPC coping tray.

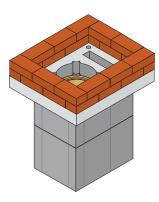

**3.** Place the chimney pot on the coping ensuring the space between the pot and coping is sealed with mortar or other non-porous material

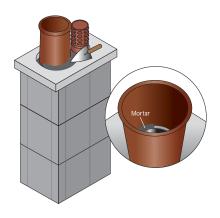

### **BRICK STACK**

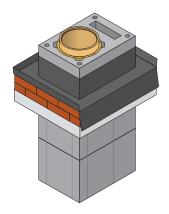

1. A corbel is required for brick or block cladding. This give a stack of 790mm x 680mm (3 bricks by 3.5 bricks).

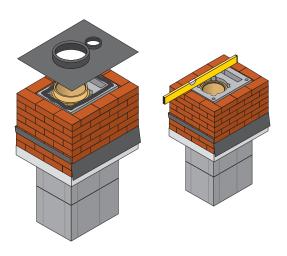

2. Continue to build the chimney block on the corbel. Keep the cavity between the block and outer skin clear of mortar. A chimney tray is recommended for brick clad stacks. Fit the chimney tray over the chimney block and let it rest on the bricks as shown with the apron on the slope side. Wall weeps should be put into the brick joints to ventilate and remove any trapped moisture.

Chimney Trays are an additional option and can be produced to specific requirements.

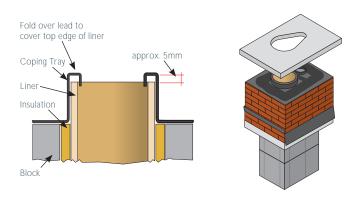

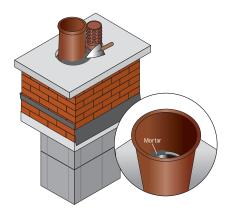

3. Before placing the coping tray into position, ensure the chimney block and the outer skin are at the same level at the top of the stack. Place the coping tray into position on a bed of mortar and ensure the gap between chimney block and outer skin is sealed properly.

**4.** Place the coping on a bed of mortar on top of the DPC coping tray.

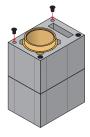

5. Place the chimney pot on the coping ensuring the space between the pot and coping is sealed with mortar or other non-porous material. Also inside the chimney pot seal the space between the pot and expansion plate with mortar or other non-porous material.

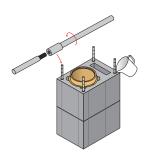

#### **REINFORCING BARS**

Reinforcement bars should be used instead of the plastic connectors for chimney stacks over 1.2m high. The bars must start 1m below the last point of lateral support.

1. Start by inserting the plastic stoppers into the holes on the block before the first one with bars.

2. Screw the bars together and inset equal lengths into the 4 holes. The liquid grouting mortar should be poured into the reinforcing channels. Keep the reinforcing bars centred.

### AFTER COMPLETION

After installation is complete tests and checks should be carried out in accordance with document J of the Building Regulations. A chimney notice plate must be completed and permanently fixed in the dwelling, ideally near the electrical consumer unit. The checklist and notice plate are available from Schiedel.

### **USE AND MAINTENANCE**

The chimney should be left for at least 72 hours before use, then start only with small fires for the first week and gently increase thereafter.

The chimney should be swept at least twice a year, once before the heating season and once after the heating season. You may need to sweep during the heating season depending upon use. The brush should be a medium density polypropylene bristle type and should be the same diameter as the flue. Steel brushes must not be used to sweep the flues.

Always follow the appliance manufacturer's operating instructions. Always burn approved fuels or dry seasoned wood. Avoid burning unseasoned wood and slow burning of solid fuels as this can produce excessive soot and condensation which in turn cause soot fires and damage. If correctly installed, operated and maintained these systems should last the life of the dwelling.

### Complementary Products and Services from Schiedel Chimney Systems

The NEW highly Insulated Twin Wall System Chimney for traditional stoves, pellet stoves, biomass appliances, mini/micro CHP and condensing boilers capable of withstanding positive pressure.

- Easy twist lock connection
- · Effective insulation
- · 100-200mm Internal diameter range

#### **PRIMA PLUS**

Single Wall Stainless Steel Flue System

- Prima Plus available 0.6mm or 1mm options for domestic multi-fuel stoves
- Prima Plus for large residential & commercial condensing gas & oil appliances & chimney relining
- 80-300mm Diameter range

#### TECNOFLEX PLUS

For relining existing chimneys to take gas, oil, wood, multi-fuel appliances and open fires.

- Twin skin TecnoFlex Plus available in 316L or 904L options for oil, wood, multi-fuel & open fires
- · 80-300mm Diameter range

Twin Wall Insulated System Chimney for gas, oil and multi-fuel applications.

- Simple push-fit jointing system
   High efficiency Superwool insulation blanket
   Capillary break prevents moisture being drawn through the joint
- 80-300mm Diameter range

### **IGNIS-PROTECT**

Designed specifically for Air Tight, Energy Efficient and Timber Framed Buildings

- Suitable for SW and DW connecting flue pipes passing through interior or exterior walls made of combustible materials
- · Available in both 90° and 45° version

#### **DM & LINERS**

Pumice System Chimneys, Firechests and Liners.

- · Pumice is a natural insulator, able to maintain the
- temperature of flue gases
   Lightweight allowing one person to lift and build the chimney units
- · Pumice expands and contracts less with temperature change than other chimney systems.
